

PRD for Emoline

Product Name: Emoline

Product Overview:

It's an application where users can store their day-to-day life journey. Traditionally, we used to write a diary, but nowadays, working professionals and students don't have that much time. We have developed an application where they just click an Emoji and write a sentence so they can store their day with this.

Problem Statement:

People want to preserve and reflect on their daily experiences, but traditional journaling requires too much time and effort, making it difficult to maintain consistently.

Target Users:

College students and young working professionals who want to journal or reflect on their day but struggle to maintain traditional journaling because it requires too much effort.

User Need:

As a user, I want to quickly record how my day went so that I can look back on my experiences and mood without maintaining a traditional diary.

Product Goal:

Enable users to record their daily mood and one meaningful memory in less than one minute and easily revisit previous entries.

Value Proposition:

People are highly motivated to store their daily problems and day-to-day tasks. With the help of a simple emoji and a short sentence, they can store their whole day's journey. It makes people get into the habit of storing it, and they can track it after a few weeks.

Core User Journey:

1. Open the application.
2. Choose your mood.
3. Write your sentence and submit.

After a week or a month, you can see the saved memories and what you have done on that day, and you can also see the data visualization of your mood for a past week or past month.

MVP Features:

Emoji → sentence → save → history/calendar → edit/delete.

Functional Requirements:

- User can select an emoji.
- He can write a sentence for that.
- He can store that.
- You can review the product things against it.
- You can edit that.
- He can see the data visualization of his weekly report and monthly report.
- And you can download that into a PDF.

Screens / Pages Required:

Onboarding/Login → Home/Daily Entry → Entry Saved → History/Calendar
→ Mood Insights → Settings/Profile

Out of Scope:

We are not using any kind of AI tool for this. There is no chat, and there is no whole paragraph reading, writing, and there is no implementation of any AI tool for the V1.

Success Metrics:

We are going to measure this with:

- how many of them are signed in to the application
- how many are actively using the application
- how many are seeing their history
- how many are editing their things
- how many of them are consistent

Edge Cases:

The data they may delete mistakenly due to a poor internet connection. They may have repeatedly added it twice to their daily track. They may lose their password as well.

Open Questions:

I haven't decided how the UI/UX should be. The second is how many emojis I need to keep. How many characters or words do we need to keep for the limit?
